

RESEARCH TRAINING PLAN

Name : Your Name

Home University : Your Home University

Research Title : Your Research Title Here

Research Advisor : Your Research Advisor
(at NUS)

Host Department/Faculty/School : Your Host Department/Faculty/School

Introduction, Objective and Outputs	Write a brief introduction to the proposed research topic. Explain the background, motivation, main objective, and expected academic or practical contribution of the project. Add another paragraph if needed. You may describe the research gap, the importance of the problem, and how this project connects to your previous academic preparation or the host supervisor's research direction.
Material and Methodology	Describe the materials, data, theories, models, or references that will be used in the project. Explain the main methodology, such as literature review, mathematical modeling, computational experiments, statistical analysis, optimization, or case studies. Add further methodological details here. If the project involves software, experiments, simulations, or proof development, briefly describe the planned tools and procedures.
Expected results and output	The project is expected to deliver: 1. A structured literature review related to the proposed topic. 2. A clear formulation of the research problem, including definitions, assumptions, and research questions. 3. Theoretical analysis, computational results, experimental findings, or preliminary empirical evidence. 4. A final research report and, if possible, a preliminary manuscript or presentation.
Research plan and timetable	Before the on-site research start: Conduct a preliminary literature review and prepare the necessary background knowledge, data, software, or mathematical tools. Week 1–2: Review the relevant literature, clarify the research objectives, and finalize the detailed problem formulation with the supervisor. Week 3: Develop the main methodology, carry out theoretical analysis, computational experiments, or data analysis. Week 4: Consolidate intermediate results, discuss findings with the supervisor, and refine the research output. Week 5 and after the on-site time: Consolidate findings, prepare the final report, and outline possible directions for further research or publication.
Links to other relevant activities	Explain how this project connects to your current academic program, previous research experience, future study plan, or the host department's research activities. You may also describe how the training will contribute to your long-term academic development, research skills, or future graduate study.
